8791/V1 Power Tube

VHF-TV Amplifier Tube

- CERMOLOX ®
- Ruggedized, Reliable
- Matrix Oxide Cathode
- Full Input to 400 MHz
- 1000 W Peak Sync Output in VHF-TV Service

The BURLE 8791/V1 is designed specifically to meet the stringent requirements of modern VHF-TV equipments. Its high gain, CERMOLOX tube construction and full input rating to 400 MHz make it ideally suited for high frequency applications such as VHF-TV grid-modulated service and VHF or UHF Class B linear service where it will deliver better than one kilowatt peak sync or 200 watts carrier output respectively.

The ruggedized, low inductance, coaxial construction of the 8791/V1 enables the use of simple, economical circuit techniques in all HF, VHF, and UHF applications.

Its matrix oxide cathode enhances system reliability while the efficient, forced-air cooled radiator reduces system air requirements and permits more reliable, lower temperature operation.

To comply with environmental design objectives, design samples are subjected to 50 g-l 1 millisecond shock; 500 g-3/4 millisecond shock; and 20 g-2000 hertz vibration testing.

This bulletin gives application information unique to the BURLE 8791/V1. General information, covering the installation and operation of this tube type, is given in the "Application Guide for BURLE Power Tubes", TP-105. Close attention to the instructions contained therein will assure longer tube life, safer operation, less equipment downtime, and fewer tube handling accidents.

General Data

Heater-Cathode:

- For maximum life expectancy, the heater-voltage must be adjusted initially and throughout life to the lowest value that will give the desired performance.
 - Before the application of any other voltages to a new tube, the heater voltage should be adjusted 5.5 volts at the tube socket. A true RMS voltmeter should be used for accurate measurement.
 - Apply voltages and adjust tuning controls as necessary for proper operation as described in the appropriate instruction manual.
 - 3. Reduce the heater voltage in 0.1-volt increments -- repeating Step 2 until performance degradation is noted. Then increase the heater voltage 0.1 volt above this point. Typically, depending upon the application, this voltage will be in the range of 4.8 to 5.5 volts.

During life when evidence is observed that a tube is becoming emission limited, increasing the heater voltage may extend the useful life of the tube. However, never increase heater voltage to compensate for **a** decrease in other circuit parameters such as RF drive or video modulating voltage!

- 2. Measured with special Adapter.
- 3. See Dimensional Outline for temperature measurement points.
- 4. See TP-105.
- Computed between half-power points and based on 1-1/2 times tube output capacity.
- 6. With 6.3 V ac or dc on heater.
- 7. Measured with special shield adapter.
- With dc plate voltage of 2500 volts, dc grid-No.2 voltage of 400 volts, and dc grid-No.1 voltage adjusted to give a plate current of 240 mA.
- 9. Under conditions with tube at 20° to 30° C for at least 30 minutes without any voltages applied to the tube. The minimum resistance between any two electrodes (except across heater terminals) is measured with a 200-volt Megger-type ohmmeter having an internal impedance of 1.0 megohm.
- With dc plate voltage of 2500 volts, dc grid-No.2 voltage of 400 volts, and dc grid-No.1 voltage adjusted to give a plate current of 5 mA.

Mounting

See the preferred mounting arrangement in Figure 5. See TP-105 for a description of the fixed method of mounting. The adjustable method is not recommended for the 8791 /V1. Special sockets are available. (See page 2.)

Forced-Air Cooling

Air Flow:

Through radiator -- Adequate air flow to limit the plate-core temperature to 250° C should be delivered by a blower through the radiator before and during the application of heater, plate, grid-No.2, and grid-No.1 voltages. In typical operation at 750

HEATER VOLTAGE (E,) .. 6.3 V GRID No.2 VOLTAGE (E_{c2}) = 350 V PLATE CURRENT I = -GRID No. 1 CURRENT $I_{c1} = ---$ GRID No. 2 CURRENT I = ----No. I VOLTAGE 1500 2000 PLATE VOLTAGE - VOLTS

Figure 1 - Typical Constant Current Characteristics ($E_{co} = 350 \text{ V}$)

watts plate dissipation and 200° C plate core temperature 12 cfm at 0.36 inch of water at 22° C ambient air temperature should be sufficient as shown on Air Flow Chart.

To Plate, Grid-No.2, Grid-No.1, Heater Cathode, and Heater Terminals--A sufficient quantity of air should be allowed to flow past each of these terminals so that their temperature does not exceed the specified maximum value of 250° C.

During Standby Operation -- Cooling air is required when only heater voltage is applied to the tube.

During Shutdown Operation --Air flow should continue for a few minutes after all electrode power is removed.
